RE: Analysis of HVAC Air Filters from Southeast Chicago (EH&E 19251)

Dear Mr. Czerniak and Ms. Cantello:

Environmental Health & Engineering, Inc. (EH&E) provides this report summarizing the chemical analyses of air filter samples obtained by the U.S. Environmental Protection Agency (EPA) of heating, ventilating, and air conditioning systems (HVAC) of two homes in the South Deering and East Side neighborhoods (“the Neighborhoods”) of Chicago, Illinois, during July 2014.

In summary, the levels of polynuclear aromatic hydrocarbons (PAHs) and metals in the air filters are not consistent with the presence of petroleum coke or coal, but instead are associated with indoor and outdoor air, settled house dust, and soil reported for Chicago and other urban areas in the United States. As detailed below, this conclusion is based on comparing proportions of indicator chemicals¹ measured in the air filters to proportions measured in 1) indoor and

¹ Indicators include the ratio of vanadium to nickel and proportions of 16 PAHs (naphthalene, acenaphthylene, acenaphthene, fluorene, anthracene, phenanthrene, fluoranthene, pyrene, benzo(a)anthracene, chrysene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(g,h,i)perylene, indeno(1,2,3-cd)pyrene, dibenz(a,h)anthracene). Values for additional PAHs (1- and 2-methylnaphthalene) were provided in lab analysis for the HVAC air filters but were unavailable in some of the reference data. We did examine proportions of the 16 PAHs included in this report, plus these additional PAHs in the media for which these data were available (i.e., soil, petroleum coke, coal), and our findings remain unchanged.

outdoor air, settled house dust, and soil of Chicago and other urban areas; and 2) petroleum coke and coal from the KCBX Terminal Company North and South terminals in Southeast Chicago.

HVAC AIR FILTER SAMPLES

EPA provided samples of air filters reported to have been obtained from the HVAC systems of two homes in the Neighborhoods during July 2014. EPA also provided additional filter material to be used as blank samples, although information on the origin of this material was not provided. EH&E received the samples on July 17, 2014. The samples were analyzed for PAHs and metals the following week.²

The HVAC filter results were compared to one another during a preliminary analysis. The total loading of PAHs and metals was greater in one of the filters compared to the other; however, the levels of PAHs and metals were strongly correlated between the two filters.³ Levels of PAHs and metals found in the two blank filters were comparable to one another. Proportions of metals detected in the used HVAC air filters were also consistent with proportions found in the blank samples. We also note that levels of naphthalene and 2-methylnaphthalene in one of the blank samples were higher than levels observed in its corresponding used HVAC air filter sample.

PETROLEUM COKE AND COAL SAMPLES

Petroleum coke and coal samples were collected from the KCBX North and South terminals in November 2013 and March 2014, then subsequently analyzed for concentrations of PAHs and metals. Results of those analyses were reported previously by EH&E⁴ and EPA.⁵

REFERENCE DATA

To aid with interpretation of the filter results, data were obtained for PAHs and metals in environmental media that could reasonably be expected to contribute to material captured by residential HVAC air filters. These media include: indoor air and outdoor air, settled house dust, and soil. These reference data include information for Chicago and other U.S. cities obtained from the peer-reviewed scientific literature as well as prior chemical analyses of soil from the Neighborhoods and surrounding areas.

² Chemical analyses of the air filters were carried out by TestAmerica Laboratories, Inc. located in Burlington, VT. For determination of PAHs, the filter samples were digested according to EPA Method 3550C and analyzed by gas chromatography-mass spectrometry in selective ion monitoring mode according to EPA Method 8270D SIM. For determination of metals, the metal wire integral to the filters was removed and then the filter media was digested according to EPA Method 3050B and analyzed by inductively coupled plasma-mass spectrometry according to EPA Method 6020A.

³ PAHs: r = 0.82, p-value = <0.01. Metals: r = 0.86, p-value = <0.01

⁵ <http://www2.epa.gov/petroleum-coke-chicago/analysis-pet-coke-samples>

Outdoor air values for Chicago from the Northbrook Water Plant air quality monitoring station were accessed from the EPA AirData web portal⁶ and from the Illinois Institute of Technology were obtained from the published literature.⁷ Settled house dust data for PAHs were obtained from a study conducted in urban areas within the United States.⁸ Values for indicator metals in settled house dust were not identified by the literature search conducted for this analysis. Indoor air values for indicator metals in Chicago were not identified at this time; therefore, data from elsewhere in the U.S. was used.⁹ In November 2013 soil samples were collected at bus stops, intersections, and parks throughout the Neighborhoods, and results of the PAH and metals analyses from those soil samples have been reported previously.¹⁰ At that time, additional soil samples were also collected in other Southeast Chicago neighborhoods adjacent to the South Deering/East Side neighborhoods. Additional reference values for soil in Chicago were obtained from a study conducted by the U.S. Geological Survey (USGS)¹¹ and from the Illinois Tiered Approach for Corrective Action (TACO) program.¹²

ANALYSIS

The proportions of 16 PAHs and the ratio of V:Ni in the HVAC air filter samples were compared to the corresponding values in petroleum coke and coal from the KCBX terminals, and in the reference air, settled dust, and soil.

⁶ <http://www.epa.gov/airquality/airdata/> Values were averaged over a five year period (2009-2013).

⁷ Franz, et al., 1998.

⁸ Whitehead et al., 2011. Data from the Mahler et al. (2010) study referenced in Table 4 (Whitehead, et al., 2011) was used in the HVAC filter analysis. These values from seven locations are the most complete median PAH profiles identified in the literature. All seven locations were well correlated with one another ($0.52 < r < 0.96$), indicating that PAH concentrations in settled house dust are relatively consistent across the country. The authors attribute minor differences in PAH concentrations mainly to geographic differences in traffic density and in use of coal-tar based pavement sealants.

⁹ Clougherty et al., 2010; Graney et al., 2004; Habre et al., 2014; Kinney et al., 2002; Polidori et al., 2009; Yankoleva et al., 1999.

¹⁰ <http://www2.epa.gov/sites/production/files/2014-03/documents/petcoke-coal-test-results-20130112.pdf>

¹¹ USGS, 2003.

¹² Illinois EPA, 2001.

PAHs in the HVAC air filters are not associated with petroleum coke or coal based on the correlation analysis summarized in Table 1. As shown in the “Source Material” rows of the table, correlations between PAHs found in the HVAC filters and source materials (i.e., petroleum coke and coal from the KCBX terminals) were weak and not statistically significant. In contrast, proportions of PAHs in the HVAC filter samples were strongly and statistically significantly associated with the proportions in outdoor air measured in Chicago, settled house dust measured in urban areas of the United States, the TACO program, and soil samples collected in other locations in Chicago (USGS) as well as in the Neighborhoods and surrounding areas (“Reference Data” listed in Table 1). The highly consistent correlations among these media show the strong influence of urban background levels of PAHs.

Table 1 Comparison of Profiles of PAHs Measured in HVAC Air Filter Samples to Petroleum Coke and Coal Samples and Reference Data

Data Source	Correlation Coefficient Filter 1	p-value	Correlation Coefficient Filter 2	p-value
Source Material				
Petroleum coke ¹	0.06	0.84	0.12	0.67
Coal ¹	0.14	0.62	0.08	0.78
Reference Data				
Outdoor air* ²	0.89	<0.01	0.87	<0.01
Settled house dust ³	0.74	<0.01	0.76	<0.01
USGS (soil) ⁴	0.79	<0.01	0.72	<0.01
TACO (soil) ⁵	0.82	<0.01	0.80	<0.01
Southeast Chicago neighborhoods (soil) ¹	0.78	<0.01	0.73	<0.01
South Deering/East Side neighborhoods (soil) ¹	0.74	<0.01	0.70	<0.01

Correlation coefficients range between -1 to 1. Absolute values greater than 0.7 indicate a strong correlation between groups.

p-values <0.01 indicate that the correlation between groups are statistically significantly different from zero at the 0.01 confidence level.

1 Sampling data

2 Franz, et al, 1998.

3 Whitehead et al., 2011.

4 USGS, 2003.

5 Illinois EPA, 2001

V:Ni ratios measured in HVAC filter samples (median ratio=0.68) were similar to those observed in the indoor air of homes in urban areas in the U.S as well as in the outdoor air of Chicago, as shown in Figure 1. The V:Ni ratios measured in soil and air were nearly ten-fold less than ratios observed in petroleum coke and coal (median values 3.5 and 4.4, respectively), also shown in Figure 1.

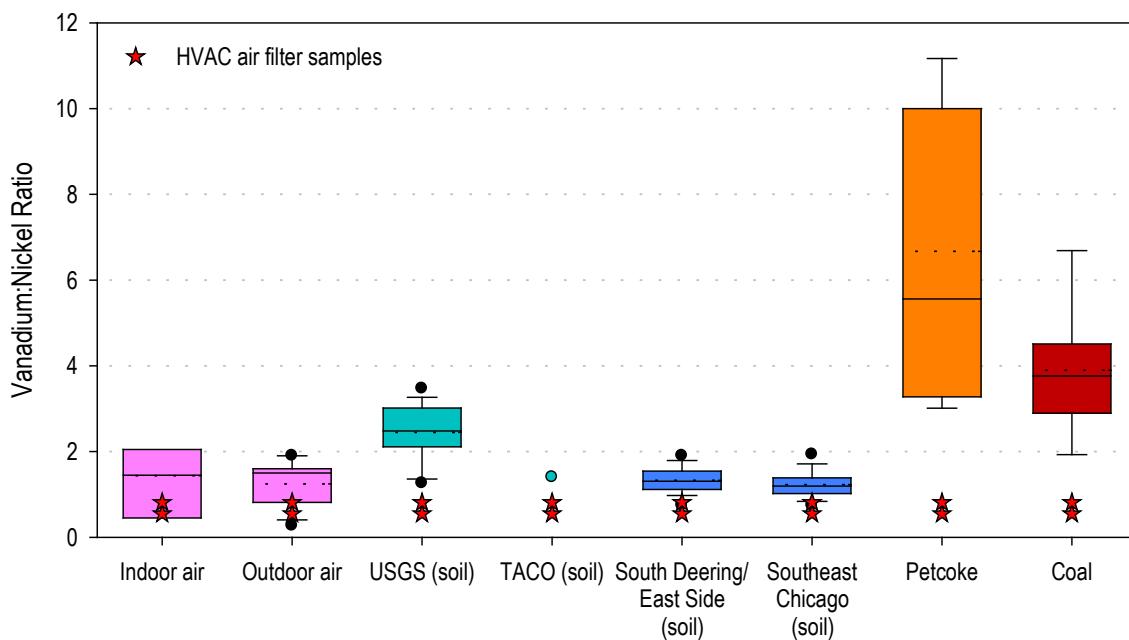

Figure 1 Vanadium to Nickel Ratios for Reference Soil and Air Samples and Source Material Samples of Petcoke and Coal Compared to HVAC Air Filter Samples from Two Chicago Homes

CONCLUSION

The data available for the two HVAC air filters at this time provide no evidence of windborne transport of petroleum coke and coal from the KCBX terminals to the surrounding community. Instead, levels of PAHs and metals in the HVAC air filter samples are highly consistent with anthropogenic background levels observed in air, settled house dust, and soil of Chicago and other urban areas in the U.S. These findings indicate that the PAHs and metals found in air filters from the Neighborhoods reflect background conditions in the Southeast Chicago area rather than impacts of petroleum coke or coal.

If you have any comments or questions regarding this report, please contact me at
1-800-TALK EHE (1-800-825-5343).

Sincerely,

David L. MacIntosh, Sc.D., C.I.H.
Chief Science Officer

Report Number: 200-23277-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 07/22/2014; the samples arrived in good condition, properly preserved and on ice. The temperature of the cooler at receipt was 3.2 C.

PAH containers received in clear 16oz jars and wrapped in aluminum foil.

No date or times listed on the container labels. Logged in per sample date and times listed on the COC.

Per client request, the sample filters were weighed and measured prior to analysis. The following are the weights and measurements for the samples:

Sample 1407001-15 PAH Filter dimensions of 15.8cm x 10.9cm and weight of 2.43g (metal mesh included)
Sample 1407001-15 Metals Filter dimensions of 17.4cm x 10.0cm and weight of 1.40g (metal mesh removed)
Sample 1407001-16 PAH Filter dimensions of 12.0cm x 10.5cm and weight of 2.93g (metal mesh included)
Sample 1407001-16 Metals Filter dimensions of 12.4cm x 9.9cm and weight of 1.35g (metal mesh removed)
Sample 1407004-01 PAH Filter dimensions of 19.2cm x 9.5cm and weight of 2.72g (metal mesh included)
Sample 1407004-01 Metals Filter dimensions of 16.7cm x 9.5cm and weight of 0.91g (metal mesh removed)
Sample 1407004-02 PAH Filter dimensions of 17.9cm x 8.7cm and weight of 2.12g (metal mesh included)
Sample 1407004-02 Metals Filter dimensions of 18.3cm x 9.0cm and weight of 0.89g (metal mesh removed)

SEMOVOLATILE ORGANIC COMPOUNDS - SELECTED ION MODE (SIM)

Samples 1407001-15, 1407001-16, 1407004-01 and 1407004-02 were analyzed for semivolatile organic compounds - Selected Ion Mode (SIM) in accordance with 8270D SIM. The samples were prepared on 07/24/2014 and analyzed on 07/29/2014.

The samples were received by the lab outside the validated holding time for extraction solid matrix samples. The results reported the samples are flagged accordingly.

Internal standard (ISTD) response for the following samples was outside control limits: 1407004-01, 1407004-02. The samples were re-analyzed with concurring results and both sets of data have been reported.

Samples 1407001-15[3.33X] and 1407001-16[2X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

Job ID: 200-23277-1 (Continued)

Laboratory: TestAmerica Burlington (Continued)

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

METALS (ICPMS)

Samples 1407001-15, 1407001-16, 1407004-01 and 1407004-02 were analyzed for metals (ICPMS) in accordance with 6020A. The samples were prepared on 07/25/2014 and analyzed on 07/28/2014 and 07/29/2014.

Due to sample matrix effect on the internal standard (ISTD), a dilution was required for the following sample for Arsenic, Selenium, and Lead: 1407001-15.

The following sample was diluted to bring the concentration of Sodium and Zinc within the calibration range: 1407001-15. Elevated reporting limits (RLs) are provided.

Internal standard responses were outside of acceptance limits for the following sample: 1407001-15. The sample shows evidence of matrix interference. Thallium recovers below the reporting limit when run both undiluted and at dilutions, therefore the undiluted analysis is reported.

Arsenic and Thallium were detected in method blank MB 200-75341/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged. Refer to the QC report for details.

Samples 1407001-15[10X] and 1407001-15[2X] required dilution prior to analysis. The reporting limits have been adjusted accordingly.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Definitions/Glossary

Client: Environmental Health & Engineering
Project/Site: Filter Sample

TestAmerica Job ID: 200-23277-1

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time
*	ISTD response or retention time outside acceptable limits

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.

Glossary

Abbreviation

These commonly used abbreviations may or may not be present in this report.

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Creator: Gagne, Eric M

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	Lab does not accept radioactive samples.
The cooler's custody seal, if present, is intact.	True	NO SEALS
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	3.2°C. IR GUN ID 181. CF = -0.2
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	NO COLLECTION TIME OR DATE ON CONTAINER LABELS.
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A
